

VayuNetra — 3-Minute Demo Video Script

Total runtime: 3:00 · three speakers · one minute each Three presenters, one minute each. The split below (Omkar → Abhinav → Sejal) is a suggested order that follows the product loop *trace* → *act* → *protect* — any of the three can take any segment.

Every beat below has a timestamp, the exact screen to show, and the exact words to say. The spoken lines are written for natural Indian-English delivery at ~140 words/minute — read them aloud twice before recording; if a line feels stiff in your mouth, reword it, but **keep every number exactly as written** (they are all verified against the live app).

Recording setup (do this once, before anyone records)

Item	Setting
Screen capture	1920×1080, browser full-screen (F11), 100% zoom, hide bookmarks bar
Camera	Each speaker records a webcam clip; editor overlays it as a small circle, bottom-left (never cover the right panel — that's where the content lives)
Audio	Quiet room, phone/headset mic 15 cm from mouth, record a 5-second silence first for noise removal
Browser prep	Open <code>vayunetra-aqi.vercel.app</code> once and complete/skip the tour so it never pops up on camera. City = Delhi .
Backend prep	Run <code>make prewarm</code> ~15 min before recording and confirm GO . If Render misbehaves, record against local <code>make dev</code> — the app looks identical.
Cursor	Move slowly, click deliberately. Every click in this script is rehearsed — no hunting on camera.

Pre-record checklist (2 min): ① tour dismissed ② Delhi selected ③ a hexagon click opens Cell Story instantly ④ Enforcement list is populated ⑤ "Run agents live" completes in a few seconds ⑥ Advisories shows Hindi text ⑦ Sejal's phone has Telegram open on @aqivayu_bot for the pickup shot.

MINUTE 1 — OMKAR · "Who is to blame, per square kilometre" (0:00–1:00)

Time	Screen / action	Say exactly
0:00–0:10	Landing page (<code>vayunetra-aqi.vercel.app</code>), slow scroll over the hero and live AQI line	"India already measures its air — nine hundred monitoring stations. Yet only thirty-one percent of monitored cities have any response protocol. Data is not the problem. The missing loop is."
0:10–0:22	Click Open console → map of Delhi loads with coloured hexagons. Sweep cursor across the map	"This is VayuNetra. Every hexagon is one square kilometre of Delhi, coloured by <i>who is to blame</i> for its PM2.5 right now — red is traffic, yellow is construction dust, purple is industry."

Time	Screen / action	Say exactly
0:22– 0:40	Click a hexagon → Cell Story panel opens (place name, e.g. R. K. Puram). Point at the source bars, then the green SHAP box, then scroll to This place — past air	"Click any cell — this is R. K. Puram. Traffic: sixty-one percent. The model shows its evidence — SHAP drivers in micrograms, with its own out-of-sample R-squared. And here is this place's own history: worse than a month ago, in plain words, over a year of readings. Where the model has no skill, it <i>abstains</i> and falls back to cited chemical signatures. It never over-claims."
0:40– 0:55	Point at "Where it's heading" (+24/48/72h numbers in the Cell Story), then click Forecast in the sidebar; hover the uncertainty band	"The same cell carries a seventy-two-hour forecast with calibrated eighty-percent uncertainty bands. Our attribution is checked bucket by bucket against the published apportionment studies, and the forecast beats persistence in every launch city — we validated everything, including our failures."
0:55– 1:00	Hold on the Forecast chart	"So we know who is to blame, and what's coming. Abhinav turns that into action."

~150 words of speech. If running long, drop the sentence "we validated everything, including our failures."

MINUTE 2 — ABHINAV · "From blame to a signed notice" (1:00–2:00)

Time	Screen / action	Say exactly
1:00– 1:15	Click Pipeline in the sidebar → click "Run agents live" → the trace fills in node by node	"Six AI agents on one LangGraph run this city. Watch them live: orchestrator, attribution, forecast — a spike gate decides if the air needs enforcement — then advisory. Zero-point-six seconds end to end, and every node is traced and auditable."
1:15– 1:32	Click Enforcement in the sidebar. Slowly scroll the worklist; point at the contribution + exposed line on the top card	"The enforcement worklist ranks every polluting source by contribution, people exposed, and actionability. Top of this list: a registered construction site putting eighteen percent of this cell's PM2.5 onto fifteen thousand residents."
1:32– 1:50	Click Evidence dossier on that card → point at the Sentinel-2 patch and the citations. Then click Notice PDF → open the downloaded PDF, scroll to the impact chart	"One click — the evidence dossier: a Sentinel-2 satellite patch of the site, and regulatory citations retrieved from GRAP and the Air Act. And here's the draft notice PDF — with a projected-impact chart: the forecast if nothing is done, versus the air after compliance. An officer signs it. We never auto-send."
1:50– 2:00	Back in the app, show the Intervention tracking card under the worklist	"The moment it's dispatched, the system freezes a baseline and starts measuring before-versus-after, corrected for city drift. And Sejal takes the same intelligence to citizens."

~150 words. The Notice PDF must be pre-downloaded once so the second download is instant on camera.

Numbers on record day: "eighteen percent ... fifteen thousand residents" matches the live top card when a cell is focused (verified 20 Jul). The worklist re-ranks with live data — before recording, read your actual top card and, if it differs, swap in its contribution % and exposed count. The sentence structure stays the same; never speak a number that isn't on screen.

MINUTE 3 — SEJAL · "Reach, rupees, and the close" (2:00–3:00)

Time	Screen / action	Say exactly
2:00–2:18	Click Advisories . Switch language dropdown English → Hindi (Devanagari text appears). Click through channel tabs App → Telegram → IVR call	"The same intelligence reaches people who will never open a dashboard. Health advisories in English, Hindi, Kannada and Marathi — targeted using five and a half thousand vulnerability-scored zones: hospitals, schools, outdoor workers."
2:18–2:32	On the Telegram tab, show the QR; cut to Sejal's phone receiving the bot message. Then the IVR tab	"Four channels. A live Telegram bot — scan and subscribe right now. Public display boards. And real IVR phone calls: citizens dial in, press one for Delhi, and the phone reads them today's advisory."
2:32–2:48	Click Simulator → intervention "Halt construction dust" → Run simulation → point at the impact cards. Then click Impact and point at the ₹ figures	"Officers can ask <i>what if</i> : halt construction dust, and the counterfactual returns the AQI change, people protected, rupees saved and CO2 avoided — every figure cited, nothing invented. The City ROI view makes Delhi's funding case: eighty-eight thousand crore avertable every year."
2:48–3:00	Click Cities (ten-city ranking on screen) — then cut to the landing page hero, hold two seconds	"Ten cities run today — seven of them onboarded from config in a single week — on zero-rupee infrastructure. India's air stack can measure and forecast. VayuNetra makes it <i>operate</i> . Thank you."

~145 words. The phone-pickup shot is the single most memorable moment — rehearse it.

Coverage check (nothing missed)

Landing ✓ (0:00) · Blame map + layers ✓ (0:10) · Cell Story: attribution, SHAP, abstention, forecast ✓ (0:22–0:55) · Forecast panel ✓ (0:40) · Pipeline, 6 agents, spike gate, latency ✓ (1:00) · Enforcement worklist ✓ (1:15) · Dossier: satellite + RAG citations ✓ (1:32) · Notice PDF + impact chart ✓ (1:32) · Intervention tracking ✓ (1:50) · Advisories: 4 languages ✓ (2:00) · 4 channels + live Telegram + IVR ✓ (2:18) · Simulator + cited impact ✓ (2:32) · Impact / City ROI ✓ (2:32) · Cities comparison ✓ (2:48) · Scalability + ₹0 close ✓ (2:48).

Not shown (deliberate, no time): guided tour, map layer toggles (plumes/wards/freight/fires are visible in the hero landing image), the 24-hour map replay, satellite hover cards, ward heat, share card, clean-air zones, optimizer, broadcast button. All are live — and every screen in this script is a deep link, so bookmark them for the recording. If a judge asks, all are live in the app.

Editing notes

- Hard cuts on every speaker change; no transitions/music under speech (light music bed at –25 dB is fine).
- Overlay small text chips when a number is spoken: "61% traffic" (0:25), "0.6 s end-to-end" (1:10), "18% · 15,000 residents" (1:25), "en · hi · kn · mr" (2:05), "₹0.88 L cr / yr" (2:45).
- End-card (2 s, after 3:00 if the rules allow a title card): logo + `vayunetra-aqi.vercel.app` + team names.
- Export 1080p, H.264, target ≤ 500 MB.
